

LOGIN & REGISTRATION SYSTEM - C++

This project demonstrates a simple Login and Registration System using C++ file handling. Users can register with a username and password and later log in using stored credentials.

Program Code:

```
#include <iostream>
#include <fstream>
using namespace std;

void registerUser() {
    string username, password;

    cout << "Enter username: ";
    cin >> username;

    cout << "Enter password: ";
    cin >> password;

    ofstream file(username + ".txt");
    file << username << endl;
    file << password;
    file.close();

    cout << "Registration successful!" << endl;
}

void loginUser() {
    string username, password;
    string storedUser, storedPass;

    cout << "Enter username: ";
    cin >> username;

    cout << "Enter password: ";
    cin >> password;

    ifstream file(username + ".txt");

    if (!file) {
        cout << "User not found!" << endl;
        return;
    }

    getline(file, storedUser);
    getline(file, storedPass);

    if (username == storedUser && password == storedPass)
        cout << "Login successful!" << endl;
    else
        cout << "Invalid credentials!" << endl;

    file.close();
}

int main() {
    int choice;

    cout << "1. Register\n2. Login\nEnter choice: ";
    cin >> choice;

    if (choice == 1)
        registerUser();
    else if (choice == 2)
        loginUser();
    else
        cout << "Invalid choice!" << endl;

    return 0;
}
```

Sample Outputs:

Registration Output:

Output

```
1. Register
2. Login
Enter choice: 1
Enter username: captain
Enter password: 2006
Registration successful!
```

Login Output:

Output

```
1. Register
2. Login
Enter choice: 2
Enter username: winner
Enter password: 2007
User not found!
```
